PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED FEBRUARY 15, 1964

CLAM-ASSOCIATED HEPATITIS - New Jersey and Pennsylvania

An outbreak of infectious hepatitis transmitted through raw clams has been reported by New Jersey and Pennsylvania. The outbreak commenced in October and appears to have terminated in late January. The clams were harvested along the South-Central New Jersey coast in the Pleasantville area. Several clamming areas in South and South-Central New Jersey have now been closed.

Since early October, 111 cases of infectious hepatitis among persons who had consumed raw clams in the preceding 10 to 60 days have been reported from Eastern Pennsylvania and New Jersey. Fifty-six of the cases were reported from Pennsylvania; 53 from New Jersey. In New York City two additional cases were discovered who had consumed raw clams approximately 30 days

before in the Pleasantville, New Jersey area. Adults accounted for 104 of the 111 cases.

A graph of cases, by date of onset, shows a primary

peak in mid-November and a secondary peak in early January (See graph, preceding page).

Intensive tracing revealed that the clams had been purchased in a number of restaurants and seafood markets located predominantly in Southern New Jersey and in the Philadelphia metropolitan area. The clams had been supplied to these outlets by a variety of wholesalers and shippers. Clam sources for 79 cases have been traced to date; for 17 additional cases, information regarding restaurant sources did not permit tracing. Thirty of the 79 consumed clams supplied by a single primary source; the clam source for 26 of the 30 was the Pleasantville area on the south central New Jersey coast and for 4 this source was from an area approximately 35 miles to the north. Forty-six of an addition 49 cases consumed clams distributed by wholesalers whose sources were multiple but included large shipments from the Pleasantville area at appropriate dates.

HEPATITIS - ATLANTIC COUNTY, BY DATE OF ONSET

In Atlantic County, where Pleasantville is located, an intensive survey was conducted of all hospitals and more than 120 physicians to discover all possible hepatitis cases since January 1963. In all, there were 52 cases of hepatitis of which 19 were among those under 20 years of age; 33 were 20 years of age and older. Fifteen of the 33 adult cases reported having consumed raw clams in the preceding 10 to 60 days. As shown in the graph (above), the clam-associated cases cluster in the October-December period.

The secondary wave of cases in early January, noted previously, centers largely in the Philadelphia metropolitan area. Clams supplied to these cases are derived through wholesalers whose sources are multiple and, although including clams from the Pleasantville area, also include clams from multiple areas along the Eastern Seaboard. An immediate explanation for this secondary wave is not available.

Dr. Roscoe Kandle, New Jersey State Commissioner of Health, announced February 14 that several previously open areas along the South and South Central New Jersey coast have now been closed for clamming.

(Reported by W. J. Dougherty, M.D., Director, Division of Preventable Diseases, New Jersey State Department of Health; W. D. Schrack, Jr., M.D., Director, Communicable Disease Control, Pennsylvania State Department of Health; and Max Gross, M.D., Atlantic County Health Department and a team from the CDC.)

Editor's Note: This is the second outbreak of hepatitis transmitted through clams to be reported this year (See MMWR, Vol. 13, Page 37). The last previous major outbreak occurred in 1961 and was traced to clams taken from the Raritan Bay area (See MMWR, Vol. 10, number 7).

INFLUENZA - Washington State

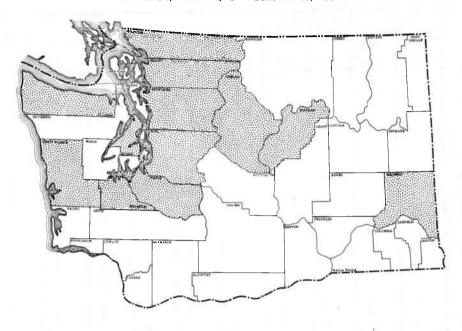

Additional outbreaks of influenza-like disease have been reported from 7 Washington counties during the past week, bringing to 12 the total number of counties involved in the current epidemic. (see map).

The disease has now spread from its original focus in the northwestern corner of the State to involve areas in central Washington as well as one eastern county on the Idaho border.

The city of Port Angeles (Clallam County) on the Olympic penisula reported school absence rates as high as 15 percent during the past week, largely attributable to acute respiratory disease. A somewhat milder outbreak has been observed in nearby Kitsap County. The city of Tacoma, in Pierce County, noted increased school absenteeism during the week ended February 14, with many reports of illness clinically compatible with influenza. A rising absence rate has also been noted in Grays Harbor County.

In central Washington, several communities in the adjacent counties of Chelan and Douglas reported respiratory disease outbreaks during the past week. These were associated with absence rates of 17 percent in some junior high and high schools.

COUNTIES REPORTING OUTBREAKS OF INFLUENZA-LIKE DISEASE
WASHINGTON, JANUARY, 27-FEBRUARY 18, 1964

Among the communities most severely affected has been the town of Tekoa (pop. 1189) in Whitman County, a few miles from the Idaho State line. School absence rates of 22-50 percent were noted last week. Cases have been typical of influenza clinically, with fever, headache, myalgia and sore throat the principal manifestations.

Significant titer rises to influenza A₂ antigen have been demonstrated in paired sera recently obtained from several patients in the Seattle-King County area. Physicians in that area have observed an increasing incidence

of influenza-like illness during the past week. While absenteeism has been only slightly increased for the county school system as a whole (based on a 20 percent sample kept under continual surveillance), absence rates have reached 12-14 percent in selected schools.

(Reported by Ernest A. Ager, M.D., Chief, Division of Epidemiology, State Department of Health, Olympia, Washington; and Donald R. Petersen, M.D., Epidemiologist, Seattle-King County Health Department, Seattle, Washington.)

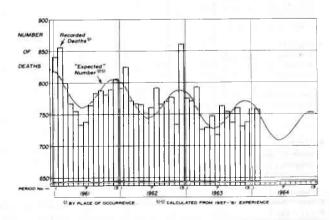

INFANT DEATHS IN 108 U. S. CITIES.

The weekly average number of infant deaths in 108 cities for the four-week period ending February 15 was 757 as compared with an expected 756 weekly average.

INTERNATIONAL NOTES - QUARANTINE MEASURES

Influenza — Japan

Preliminary reports from the Japanese Influenza Center in Tokyo suggest that the influenza B virus recently recovered from outbreaks on the island of Kyushu, is not similar to the B/Taiwan/62 strain. It appears to resemble more closely strains isolated from influenza B outbreaks in Japan in 1961. Further studies, aimed at a more complete characterization of this virus, are now in progress.

(Reported by Hideo Fukumi, M.D., Chief, Japanese Influenza Center, Tokyo.)

Immunization Information for International Travel — Public Health Service Publication No. 384, 1963-64 Edition

Section 5

OCEANIA

Australia, page 63

Delete the information under smallpox and insert:

Smallpox - Except British Solomon Islands, Fiji, Nauru, New Zealand, Norfolk Island, Ocean Island, Australian Territory of Papua and New Guinea, provided travellers have not been outside these areas for at least 14 days before arrival and these areas are free of smallpox. Australia reserves the right, in respect of arrivals from other areas, to isolate any person who arrives by air without smallpox vaccination certificate and refuses to be vaccinated. The certificate is not required from children 1 year of age.

Isolation — Under the Australian Quarantine Act, carriers are responsible for expenses of isolation of all travellers who disembark and: (a) come from a cholera infected area or an area mentioned above in the note on cholera within 5 days and do not possess a cholera vaccination certificate; or (b) come from a yellow-fever infected area within 6 days and do not possess a yellow-fever vaccination certificate; or (c) arrive by air without smallpox vaccination certificate and refuse to be vaccinated on arrival.

In addition to the established procedures for reporting morbidity and mortality, the Communicable Disease Center welcomes accounts of interesting outbreaks or cases. Such accounts should be addressed to:

> Lawrence K. Altman, M.D., Editor Morbidity and Mortality Weekly Report Communicable Disease Center Atlanta, Georgia 30333

Notes: These provisional data are based on weekly telegrams to the Communicable Disease Center by the individual State health departments.
